JavaScript Fundamentals
Lab3

1. Object Object

2.1 Write a function called dispVal that takes an object with two properties and a string as arguments. It should return the value of the property with key equal to the value of the string

Example: if created obj={nm:"ali",age:10} so that if we called our function as dispVal(obj,"age") its return value will be 10

2.BOM

2.1. Window Object

2.1.1. Create a parent window that opens a flying child window. Hint: Start by creating a parent window that opens a child window.
Child window should always be on top view and moves up and down within boundaries of user screen.
Parent window should contain a button that stops child window movement.

2.1.2. Write a script that shows a "typing message" appearing in a new child window. The new window should close after few seconds of displaying your message.

2.1.3. Create a parent a window that opens a scrollable advertising child window.
